# Background

- Estimates of fall Chinook abundance in the lower Cowlitz R. have been generated since the 1960s
- Since 2010, Chinook are monitored with aerial redd counts in conjunction with carcass sampling

## Aerial Helicopter Redd Surveys

## Boat carcass surveys

## Estimating Abundance:

Total = Peak Redd Count \* Peak Count Expansion Factor (2.84)

HORs = Total Abundance \* Prop. Hatchery carcasses

NORs = Total Abundance - HORs

# Challenges with Peak Count Expansion

- Multiple lines of evidence suggest current estimates are negatively biased
  - Creel surveys
  - Smolt trap estimates
  - Peak count expansions elsewhere
- Known limitations to current approach
  - Aerial Surveys
    - Redd superimposition
    - High/turbid water
  - Peak Redd Count Expansion
    - Assumes constant
    - Requires peak to be observed
- Take away: **accuracy** and **precision** of the estimate is unknown

# Benefits of Improved Chinook Monitoring

- Improved recovery status for ESA → closer to recovery goal, delisting
- Non-Mark Selective Fisheries
- NOAA VSP monitoring guidelines
- Properly size hatchery programs for integration
- Understand source-sink dynamics of Chinook populations within the basin

# Alternative Approach: M-R Carcass Surveys

- Ideal monitoring program:
  - Accurate abundance estimates
  - Measurable precision
  - Cost-effective
- Carcass tagging offers a high probability of success
  - High logistical feasibility
  - High probability of accurate estimates with known precision
  - Cost-effective

# Objectives: Chinook monitoring in 2021

- Conduct carcass surveys w/ M-R
  - Obtain accurate abundance estimates
  - Estimate precisions
- Conduct aerial flights
  - Continue existing time series of abundance
  - Data for future bias-correction

# Methods: Chinook monitoring in 2021

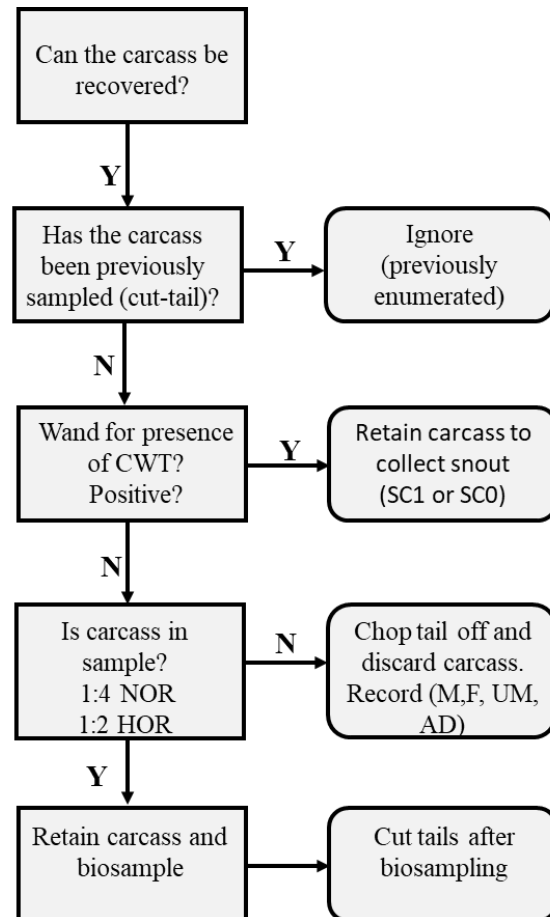

- Aerial flights for redds
  - Timing: bi-weekly (late Sept. – early Dec.)
  - Space: Castle Rock to Barrier Dam (~33 miles)
  - Approach: Count & GPS all redds via helicopter
- Carcass surveys
  - Timing: Weekly (Sept. – Dec.); 4 – 5 days/week
  - Space: Olequa Ck to Barrier Dam (~26 miles)
  - Approach:
    - Jet boats + gaffes + CWT wand
    - 2 – 4 people & 1 – 2 boats
    - Recover all carcasses
    - Sample & tag representatively

# Mark-Recapture: Data Collection & Analysis

## Carcass Survey Flow Diagram

Abundance and composition of adult Chinook escapement is estimated using an ***“open” population Jolly-Seber (JS) model*** (Seber 1982, Pollock et al. 1990).

- “super population” JS model was developed by Schwarz et al. (1993, 1996) specifically for estimating salmon spawning escapement using mark-capture methods
- Has been successfully implemented to estimate spawner escapement for other salmon populations within the Lower Columbia River (Rawding et al. 2014) and other Washington state watersheds (Ashcraft et al. 2017).

# Results: Aerial flights for redds

- Total Redds by Date

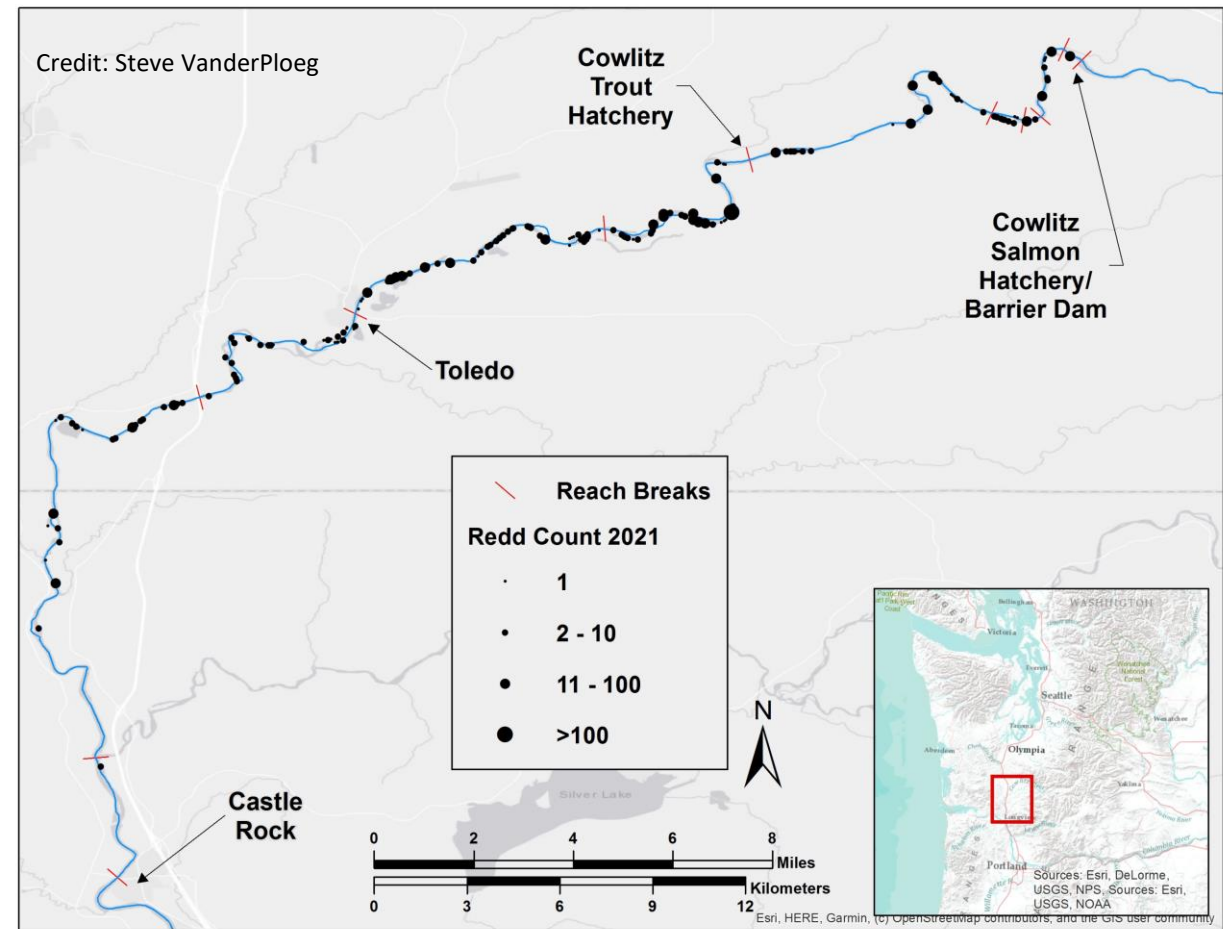

Date	Redds
22-Sep	149
6-Oct	960
21-Oct	1,076
2-Nov	1,730
17-Nov	-
1-Dec	-

Spring peak

Fall peak

- Abundance

- Total Spawners: **5,336** ( $2.84 \times (149 + 1,730)$ )
- Spring-run
  - Spawners: **423\*** ( $149 \text{ redds} \times 2.84 \text{ fish/redd}$ )
  - pHOS = 100% (6/6 HOR carcasses)
- Fall-run
  - Spawners: **4,913** ( $1,730 \text{ redds} \times 2.84 \text{ fish/redd}$ )
  - pHOS = 15% (317/1,829 HOR carcasses)

\* **Preliminary** (peak spring count conducted later in Sept than normal and redd count was likely a mixture of spring and fall-run Chinook)

# Results: M-R carcass surveys

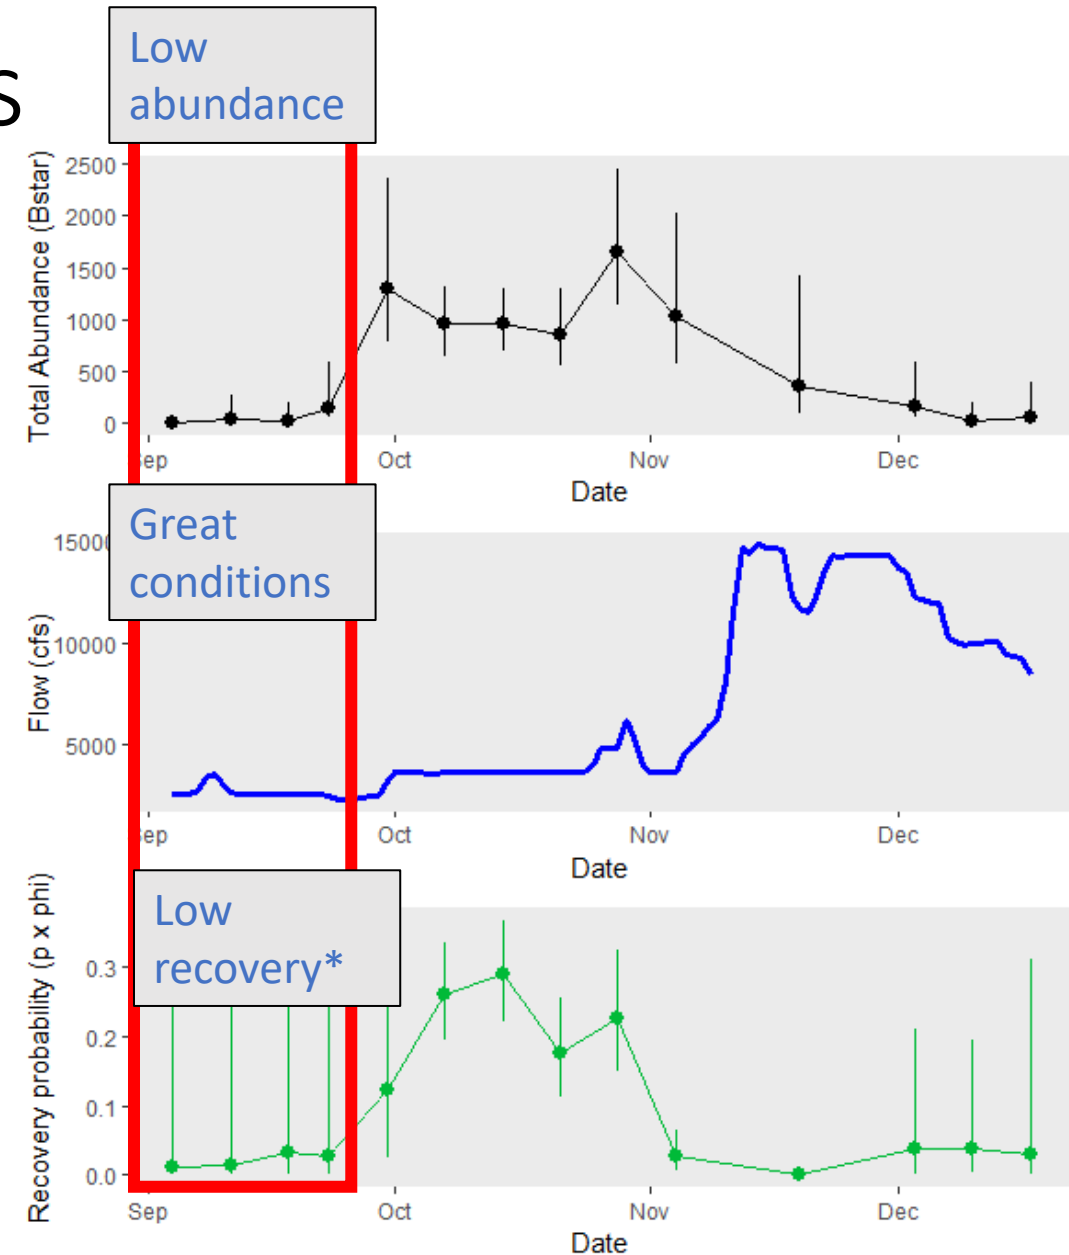

- Surveys
  - 42 days across 14 weeks (Sept. 8<sup>th</sup> – Dec. 21<sup>st</sup>)
  - Missed two weeks in mid-Nov (high flows resulting in unsafe survey conditions)
- Carcasses
  - Maiden (unique) = 2,167
  - Tagged = 903
  - Recaptured = 189
- Abundance
  - Total = **7,894** (median: 95% CI 6,380 – 10,987)
  - Spring-run
    - Spawners: **47** (median: 95% CI 9 – 310)
    - pHOS: 57%
  - Fall-run
    - Spawners: **7,827** (median: 95% CI 6,342 – 10,801)
    - pHOS: 14%

# Conclusions

- First implementation of M-R for Chinook in lower Cowlitz surveys in 30 years
- Estimates of Fall Chinook (by method):
  - Spawners: 4,913 (flight) vs. 7,827 (M-R)
  - pHOS: 15% (flight) vs. 14% (M-R)
- Recommendations:
  - Tag more fish
  - Increase survey effort following outages
- Next steps:
  - Short term → continue concurrent surveys
  - Long term → carcass tagging or updated expansion
